

## ***Release Announcement for 3.1.0 of:***

# **SYSchange<sup>®</sup>**

### **New Release**

The new release of SYSchange, 3.1.0, includes enhanced security features, improved auditing capabilities, a direct interface to the IBM SMP/E process for centralized SMP/E maintenance, enhanced disaster recovery software synchronization, and automated facilities for centralized LPAR change management. Several other fixes and new enhancements add greater flexibility to SYSchange.

- New Fixes
- Dynamic Enabling of SYSchange SAF Router Exit
- New Programs for Disaster Recovery and SMP/E Centralized Maintenance
- Expanded Packaging Capabilities
- New Commands and Parameters for Disaster Recovery Processing
- New Parameter for Activation/Deactivation of CSAVE Command
- New Logging Capabilities for Activities of SYSchange Administrators
- Removed the Restriction on Number of Change Request (CR) Approvers
- Feedback System for Multiple LPAR Change Management
- Enhancements at RECOVERY

**Note:** A new LPAR record, which stores the information of the LPAR on which SYSchange is initialized, has been added to the SYSchange Control File. When a package is promoted on a target LPAR (local or remote), this record is copied from the Control File into the Feedback File, generated on the LPAR on which a package is promoted. This file is then returned to the central site where the package originated. This way, from a single central location, SYSchange can track all promotions occurring on different LPARs. Also, a new LOG record has been added to the SYSchange Control File, to track all activities performed by the SYSchange Global Administrator.

Due to the new enhancements, the SYSchange Control File is not downward compatible.
