

Rocket Software is proud to announce the release of **FastAudit Release 10.1**. This version continues to provide new and existing customers with exciting new auditing functionality and additional capabilities. New enhancements available in this release include:

- **Control/T Tape Support**
FastAudit now supports tapes controlled by Control/T from BMC. This adds yet another tape management system that *FastAudit* will audit to report errors and discrepancies between HSM, the catalog, and the tape management database.
- **New IBM Error Correction Automation**
FastAudit now provides a second type of automation for correcting reported errors and discrepancies. Customers can now correct errors as if they were running native IBM Enhanced Audits with the FIX option specified.
- **Historical Database Recording**
FastAudit now keeps a history of all previous audit runs, as well as a copy of the summary information within a database. This is an extremely useful tool for monitoring and reporting progress and errors for trending and optimizing the development environment.
- **Cross-System Communications**
FastAudit now supports cross-system communications for environments running multiple DFSMSHsm started tasks on different LPARS and accessing shared control data sets, which facilitates centralized use and reporting.
- **New *FastAudit* Started Task**
Functionality can also be bypassed for sites not wishing to implement the started task or cross-system functionality.
- **Expert Advice**
Soon to be available by PTF will be Expert Advice for recommended actions when correcting reported errors. This will be a useful add-on to the product because users can quickly look up errors and see the recommended action for correction from within the product.

Contact your Mainstar account manager or email info@mainstar.com for more information. *FastAudit* is now available for download from the [Rocket Customer Portal](#).

Please note that the drop support date for *FastAudit* 8.1 is January 1, 2011.
